(57) Abstract :
AUTOMATIC SIDE MIRROR FOLDING SYSTEM USING ULTRASONIC SENSOR The invention relates to an automatic side mirror folding system (100) using an ultrasonic sensor (106) and a microcontroller (108) to detect nearby obstacles and automatically fold side mirrors (114). The system includes a buck converter (104) that steps down vehicle battery (102) voltage to power the microcontroller (108) and ultrasonic sensor (106). When the sensor detects an obstacle within a set distance (e.g., 45.7 cm), the microcontroller activates a motor assembly (112) via a driver (110) to fold the mirror, preventing damage. The system offers safety, convenience, and protection in narrow or crowded spaces. FIG.1
